## JOB MARKET PAPER

[“Feasible Weighted Projected Principal Component Analysis for Factor Models with an Application to Bond Risk Premia”](#)

*Abstract:* In this paper, I propose a feasible weighted projected principal component (FPPC) analysis for factor models in which observable characteristics partially explain the latent factors. To estimate the factors efficiently, I take into account both cross-sectional dependence and heteroskedasticity by using a consistent estimator of the inverse error covariance matrix as the weight matrix. To estimate the factors accurately, I employ a projection approach using characteristics because it removes noise components in high-dimensional factor analysis. My FPPC estimators of the factors and loadings have faster rates of convergence than those of the conventional factor analysis. Moreover, I suggest an FPPC-based diffusion index forecasting model. The limiting distribution of the parameter estimates and the rate of convergence for forecast errors are obtained. Using an empirical study with U.S. bond market and macroeconomic data, I demonstrate that the proposed model outperforms benchmark models based on conventional principal component estimators. I also show that the proposed model performs well among a large group of machine learning techniques in forecasting excess bond returns.
